

I would like to see us use funds to repair our field center damage by purchasing clean sand and reseeding early Sept. giving the grass a chance to start growing then hopefully by spring we'll be able to mow. Then we can set the new mower to a very close cut and roll the field to compress the soil like golf course fairways. Then we can determine if the smaller electric planes can manage a safe takeoff roll and lift off plus a return safe landing without damage. As we have already purchased the new storage box I would prefer we finish that project before we even consider the runway upgrade. On a side note if we can get an accurate materials list for the box I can see if my friend who is a home builder and buys from Builders on Clearwater I may be able to get us contractor pricing. Thank you
